

### **Work in laboratories and familiarization with construction materials**

The College has three majors, and we introduce all students to building materials, as well as test their strength.

During the review, I provided various types of materials, explained how and where they are used, their composition, cons and also pros of these materials.

For designers and architects, the main finishing materials are shown, and the use of these materials for the design of buildings, facades, interiors, etc. is describe.

Here I introduced the materials of students majoring in architecture and design

The Builder must first know the composition, density, and strength of materials.

In this process, we poured heavy concrete with different compositions and tested it on a hydraulic press.

And for builders she held a master class on testing concrete on construction sites
